	Data Migration Service

Data Migration means the process of migrating Clients current soft data which is still relevant to the current Rental business to the iHire Software.

iHire Software IT experts will study the existing current soft data in consultation with the clients team in order to decide on the relevant data which must be and could be migrated. Every attempt will be made to migrate the current data, but it is possible that due to technical difficulties or data formatting, some or all of the data cannot be migrated.

The data which may be migrated includes: customer information, vendor information, customer invoices, customer payments, employee information, asset information, vendor payments, etc.

Data which is only on paper is not considered in the data migration process. However, this can be manually entered once the system is up and running.
